

Practical – 5

Objective: Design a class to represent a Bank Account with proper data hiding and member functions for deposit and withdrawal operations.

Algorithm:

1. Start.
2. Create a class BankAccount.
3. Declare private data members: Account Number ,Account Holder Name ,Balance
4. Create a public function setDetails() to initialize the account details.
5. Create a public function deposit(amount):
 - Add the deposit amount to the balance.
 - Display the deposited amount.
6. Create a public function withdraw(amount):
 - If the amount is less than or equal to the balance:
Subtract the amount from the balance.
Display the withdrawn amount.
 - Otherwise:
Display "Insufficient Balance".
7. Create a public function display() to show the account details.
8. In main():
 - Create an object of BankAccount.
 - Call setDetails().
 - Display account details.
 - Perform deposit operation.
 - Display updated details.
 - Perform withdrawal operation.
 - Display updated details.
9. Stop.

Flow Chart:

Input:

```

#include <iostream>

using namespace std;

class BankAccount{
private:
    int accountNumber;

    string accountHolder;

    double balance;
public:
    void setDetails(int accNo, string name, double bal) {
        accountNumber = accNo;
        accountHolder = name;
        balance = bal;
    }

    void deposit(double amount) {

```

```

        balance = balance + amount;

        cout << "Amount Deposited: " << amount << endl;
    }

    void withdraw(double amount) {
        if (amount <= balance) {
            balance = balance - amount;

            cout << "Amount Withdrawn: " << amount << endl;
        }
        else{
            cout << "Insufficient Balance!" << endl;  }
    }

    void display(){
        cout << "\nAccount Number: " << accountNumber << endl;

        cout << "Account Holder: " << accountHolder << endl;

        cout << "Balance: " << balance << endl;

    };

    int main(){

        BankAccount acc;

        acc.setDetails(101, "Nandini", 5000);

        acc.display();

        acc.deposit(2000);

        acc.display();

        acc.withdraw(3000);

        acc.display();

        return 0;}

```

Output:

```

Account Number: 101
Account Holder: Nandini
Balance: 5000

Amount Deposited: 2000

Account Number: 101
Account Holder: Nandini
Balance: 7000

Amount Withdrawn: 3000

```
